Control Theory and PDE's

Control Theory and PDE's Dustin Connery-Grigg December 14, 2012 1 Introduction Differential equations are extremely useful tools in modelling all sorts of dynamical systems As mathematicians, studying them for their own sake is an entirely acceptable, and even laudable venture

An Introduction to the Controllability of Partial ...

Consider an evolution system (either described in terms of Partial or Ordinary Differential Equations (PDE/ODE)) We are allowed to act on the trajectories of the system by means of a suitable control (the right hand side of the system, the boundary conditions, etc) Then, given a time interval $t \in (0, T)$, and

Control of Systems Governed by Partial Differential Equations

We write systems modelled by partial differential equations in a similar way The main difference is that the matrices A becomes an operator acting, not on \mathbb{R}^n , but on an infinite-dimensional Hilbert space, Z Similarly, B maps the input space into the Hilbert space Z More detail on the systems theory described briefly in this section can be found

Optimal Control of PDE Theory and Numerical Analysis

control and the state In the next sections this state equation will be a partial differential equation, y being the solution of the equation and u a function arising in the equation so that any change in the control u produces a change in the solution y However the origin of control theory ...

Partial Differential Equations

The aim of this is to introduce and motivate partial differential equations (PDE) The section also places the scope of studies in APM346 within the vast universe of mathematics 111 What is a PDE? A partial differential equation (PDE) is an equation involving partial derivatives This is not so informative so let's break it down a bit

Differential Equations - LSE

but simply to distinguish them from partial differential equations (which involve functions of several variables and partial derivatives) We shall also deal with systems of ordinary differential equations, in which several unknown functions and their derivatives are linked by a system of equations An example: $\frac{dx_1}{dt} = 2x_1x_2 + x_2$ $\frac{dx_2}{dt} = x_1$
